

Soluble Methane Monooxygenase Type Oxygen Activation at an Iron(II)-Cyclam Center

Start Time: Sunday, September 13, 2020

End Time:

In an interdisciplinary approach, the three UniSysCat research groups of Holger Dau, Peter Hildebrandt and Kallol Ray studied the reaction of a non-heme iron(II) complex with dioxygen to form an oxoiron(IV) complex via an unprecedented mechanism. This work sheds light on the chemistry of dinuclear non-heme iron enzymes like Soluble Methane Monooxygenase, catalyzing the conversion of CH_4 to CH_3OH , one of the most difficult chemical oxidations.
